Mass and energy are essentially the same things they just change forms. Physics tells us that mass is a form of energy. Light is a particular wave length of energy. In the beginning God said "Let there be light". Is light energy? Physicists cannot agree about exactly what light is. Some say it is a mass, some say energy, and some say mass and energy. Light acts like both, exhibiting the traits of a wave and a particle. There is a great debate in physics as to whether it is a particle or a wave. However, it does exert force that can be measured. It seems to have mass, but as energy and mass are related, this is not surprising. Light seems to have the properties of both mass and energy. It cannot be stored we know that for sure. If you stop it, it converts to heat energy so it is definitely energy, and you can measure the force of it when it moves. You may have heard of the solar winds which is a stream of charged particles released from the upper atmosphere of the Sun called the corona. This plasma mostly consists of electrons, protons, and alpha particles with kinetic energy between 0.5 and 10 keV. I believe what God said was let there be energy. The translation of the original meaning is clear if you understand physics. The universe is made of energy. If God said let there be energy, then visible and every other waveform of energy including nonvisible forms of radiation such as heat, X ray, Gamma particles, Microwaves and anything else you can think of in the spectrum was to be sourced from it. Mass is and was formed from that energy. If you wanted to be specific about the word "light" in Genesis being visual, how could you be? If "light", only means the visible spectrum, how can that hold true, because if God said "let there be light" it is simply not possible that he meant a visible spectrum of light without creating the other forms of energy and mass. It makes spiritual, scientific, and common sense to say the interpretation should be energy. It makes perfect and absolute scientific sense that God started the ball rolling by saying let there be energy. From that however we can see light as all things came from electromagnetic energy. Note that the Sun was created in chapter 4 of Genesis after "light" in chapter one. Astronomers look back in time to the start of creation with radio telescopes and see light.
