Abstract

The Ebola virus has appeared once before, a few years ago and caused a stir, in Africa. A huge effort was undertaken by WHO and by many health authorities to understand and contain the virus. The furor subsided a few months later when the authorities indicated that they have the Ebola virus under control; they have a vaccine, and some kind of a cure for it. We even wrote a manuscript on Ebola and how to eliminate it using the techniques developed based on the theories of the ancients; vibrational herbal medicine. This year, a new out- break of a “new strain” of the Ebola virus appeared in DR of Congo and some neighboring countries, which the old vaccine and treatment did not work. Referring back to my piece on the Ebola virus, the difference between the old strain and the “new strain” was not in the change in the power of the virus, which would change the cure dramatically, but rather in the energies of the virus. To explain that, the Q energy of the old strain was -24, while the Q energy of the “new strain” was -40. However, they had the same power. The cure that we designed, some time back, was still effective, just one extra dose of two 900 mg capsules after the previous two. The vaccine made, still worked fine and gave an immunity of 12 months from Ebola infections. In our mind, the chemical vaccines, and cures, by Pharma companies, appeared to be directed in a different direction.

Keywords: *Ebola Virus Disease (EVD); Q Energy; Chemical Vaccines; Vibrational Herbal Medicine (VHM); Ebola Hemorrhagic Fever (EHF)*

Introduction

Definition: Ebola virus disease (EVD), also known as Ebola hemorrhagic fever (EHF) or simply Ebola, is a viral hemorrhagic fever of humans and other primates caused by ebolaviruses. The disease has a high risk of death, killing between 25 and 90 percent of those infected, with an average of about 50 percent [1]. This is often due to low blood pressure from fluid loss, and typically follows six to sixteen days after symptoms appear [1].

In 2019, we published a manuscript in *Biomedical Journal of Scientific and Technical Research*, detailing our concept of the treatment of the Ebola virus using vibrational herbal medicine (VHM), which emerged as a new healing technique, employing the concepts of the Wisdom of the Ancients, with a present twist. This concept has been in creating an alternative healing technique which has been publicized by the many publications, in the treatment of various ailments and diseases. Many are mentioned in the reference section. Today, a new threat of the Ebola virus spreading in several African countries, has again concentrated the focus on the treatment of this Ebola outbreak. One element has changed. This is a new powerful strain of the Ebola virus, to which no cure nor vaccine, has been developed for it yet. Luckily enough, we made some preliminary checks on our (VHM) and the new strain of the Ebola virus.

Our approach to healing or curing a disease, is slightly different from the research-oriented pursuits. We directly determine the cause of the disease, vibrationally, and determine the energies to eliminate the cause of the disease. It is actually easier, were the disease is of viral origin. This is explained in previous manuscripts detailed in the reference section.

Procedure

The initial step is the identification of the parameters of the virus in question. Our previous information on the Ebola virus is as follows, from the publication in 2019:

- $Q = -24$
- $Y_n = -24$
- $Y_g = -30$
- $\Omega = -18$.

The size of the virus was estimated to be 1,660,000 replicating units, the main element of the virus is the replicating part, which we estimated it to be 10 to the power of 1350. We developed a cure based on those parameters. However, it appeared that we estimated that there are 5 strains of the virus. They all had the same replicating power but differed in the size of the number of replicating parts. All these values were considered in making a cure to eliminate the virus in the shortest time period. We also estimated that the cure has to be administered possibly within 5 days of an infection, for the cure to be totally effective. We did not speculate on the consequences of taking the cure after 5 days of being infected.

The very recent outbreak of the Ebola virus in DR Of Congo, parts of Uganda and parts of Southern Sudan, made headlines all over the world, simply because this new strain of Ebola, did not respond well to the previous cures nor the vaccines. That prompted us to study this new strain and find out its parameters, and how different it is, from the 2019 strain.

The specimen of the new strain was obtained on-line (), and its parameters checked.

- $Q = -40$
- $Y_n = -40$
- $Y_g = -40$
- $\Omega = -16$.

These are they energy characteristics of this strain of the Ebola Virus. Its power is 1,350,000. Which is similar to the strain of 2019.

In checking its reaction to our VHM cure, we discovered that the cure works well; but with a slight change in the dosage format. This needs two capsules of the cure to be administered every 12 hours, three consecutive times, that is over a period of 36 hours. This will totally eliminate the virus.

The older strain needed two capsules every 12 hours, 2 consecutive times, of the same cure.

The cure

In 2019, when writing our first study on the Ebola virus, we designed an effective cure to eliminate the virus in one day; two 900 mg capsules of the cure, every 12 hours, twice. That was sufficient to eliminate the virus in that short time. It totally eliminated the energies of the virus, and thus the virus. When testing for the latest strain, the energy structure of the virus was different. Although the replicating power of the virus was the same, the energies of the whole virus was different. On testing the cure on this new strain, it eliminated the

energies of the virus in three doses, of two capsules of the cure each. That is one more dose than the original strain. We do have a viable cure. It may be designed on a different concept, but the objective is the same, to eliminate the virus

The cure of the Ebola virus:

1. -Q
2. Q Yn Yg
3. -Q
4. Q -Yn Yg
5. Q Yn -Yg
6. -Q
7. -Q Yn Yg.

Each one of the 7 herbs indicates the designation of that Herb. They are all common herbs, that are found in most house-holds. There are no known side effects to this cure, it is practically safe. There is one condition for that treatment, the administration of the cure be within 5 days of the appearance of the symptoms. For the time being, this is the best form of weapon against that disease.

The vaccine

The development of the vaccine, in this particular method, is a new approach in vaccinations. This method was developed during the Covid-19 era, and gave us the most powerful and effective vaccine against covid-19. It is a 9-month vaccine, zero infection rate for 9 months. The vaccinated person is totally safe. There are no side effects, and no allergic reactions. The herbs used, are used based on their vibrational qualities. These herbs are common herbs used by many people in their food and drink. In our procedure to design the Covid-19 Vaccine, we had many patients diagnosed with covid-19, just by measuring the energy characteristics of the virus in the patient. One question loomed on the horizon, why does a person A get Covid-19 and person B does not? From the various tests made on patients and non- patients, it was revealed to us that, for some unknown reason, Covid-19 would be able to access patient A, if his affinity to Covid-19, was $Q = 7$ or less. If it were more, covid-19 virus could not penetrate the body. Checking our patients, it is discovered that all covid-19 patients had a Q affinity of less than 7.

Since the covid -19 vaccine was quite safe and effective for nine months, we reasoned that we may be able to use the same method to obtain an Ebola vaccine. We started to determine the affinity Q value for Ebola virus to enter into a patient This value was checked and determined to be $Q = 20$. This is a high affinity, meaning a powerful infection power. This value was determined for the new Ebola strain, which was causing a great deal of confusion. The vaccine must be able to maintain a high value for Q against Ebola in humans, for along time, to ensure an effective vaccine.

The design of the vaccine indicated that it would raise the affinity level of humans up to about $Q = 90$.

This value would decrease over a 12-month period to $Q = 25$. This value is still higher than the affinity for Ebola, which keeps the person safe, up to 12 months. This vaccine is in the form of capsules, two 900 mg capsules daily, for three days, gives an immunity from the virus for 12 months.

The vaccine mixture:

1. Q Yn -Yg
2. Q -Yn Yg

3. -Q
4. Q Yn -Yg
5. -Q
6. Q-Yn Yg
7. Q Yn -Yg.

The dosage of this vaccine is three days. Two capsules daily for three days, gives an immunity of 12 months from the virus. This was tried with old specimens of Ebola and the new strain, and they both gave positive results.

Results

1. Our endeavor to obtain a cure for the deadly Ebola virus, was fruitful. It also paved the way for the designing of a vaccine. Although our original design of the cure was based on the original strain (the 2019 strain), it is also applicable to the new strain, with just an increase of the dosage by one extra dose.
2. The dosage of the vaccine is the same, by just increasing the dose by one extra dosage. It has the same effect of 12 months immunity.

Conclusion

Utilizing our experience gained over many years of research on the treatment and cure of viruses, and our success in designing several vaccines, namely the Covid-19 vaccine, we started to work to obtain a cure for the Ebola virus, and consequently make a vaccine to prevent its spread. Our methodology had already been determined many times before; we identify the power of the virus then its size. Then determine if it has other strains or genotypes, to incorporate all in one cure and one vaccine, if possible. We studied the reaction of the new strain of the Ebola virus, with the cure that we had made previously, it is effective, and thoroughly eliminates the new strain in four doses of 1800 mg of the cure every 12 hours.

The vaccine has the same effect, and needs to be taken four doses 1800 mg of the vaccine, for four consecutive days [2-14].
