I have been working for ten years with personal efforts to define and introduce autism to medical workers, who are interested in this disorder without health professions and autistic families by publishing introductory articles on my Facebook page or through some programs offered via satellite channels, especially after the increase in the number of children People with this disorder in my country, Iraq and around the world, and through these experiences.

This work, whether on Facebook or via satellite channels, had a great and distinctive role in raising awareness of cases of autism, as I received many calls via phone or social media from parents of children suffering from communication problems, the most important of which is the difficulty of communicating with parents and the environment, Speech lack or absence of interaction with events and doing repetitive actions without a specific goal, some parents were doctors whose children suffered from hyperactivity and poor social communication, but they did not take the issue seriously, but attributed it to family reasons for similar cases that happened to a member of the family in the past But disappeared after a while without anyone's intervention, but their follow-up to my articles and TV interviews made them think that their children might have autism, and my advice to them was to see doctors. The review of doctors specializing in mental and developmental disorders, which contributed to the diagnosis of many cases. This early awareness contributed to the rapid intervention in the early stages of the disorder, which contributed to modifying some behaviors and improving the lives of children by working to increase their concentration and enhance their communication with their families and communities. This work had a prominent role It is important in the field of early diagnosis, early intervention, and alleviation of the suffering of autistic children and their families. It was also useful to me personally, which is to see the various aspects related to this disorder, in addition to getting to know many people with specialists as well as families and benefiting from their information and experiences.

I got to know some people interested in this disorder, introducing it and helping families to early diagnose the disorder by publishing the main features, symptoms and signs or by using certain standard schedules of diagnosing the disorder in different age groups, and then early intervention through behavioral modification programs To make the lives of those children and their families easier, And taking their hands to overcome many of the problems they face. Our team will be transcontinental, countries and cities by providing all forms of assistance to this important segment of our societies with all professionalism, Keeping our main goal in mind, which is to help diagnose more cases early, intervene and work on this behavioral modification programs, in addition to thinking and working to create a bright future for those children with this disorder by integrating them into society and making active and useful elements not people who are dependent on their families.
