### Abstract

A total 45 fish samples (*Tilapia*, *Claris*) were collected from EL-Bagoria, EL-Menofi drainage and Bahr Shibin for detection and determination of organophosphorus pesticides (diazinon, Malathion and chlorpyrifos).

Organophosphorus pesticides could not be detected in Bahr Shibin.

No diazinon in *Tilapia* from EL-Bagoria but mean value of malathion  $5.50 \pm 2.0$ , chlorpyrifos  $5.0 \pm 1.66$  but from EL-Menofi drainage mean level of diazinon  $3.33 \pm 0.65$ , malathion  $4.98 \pm 1.22$  and chlorpyrifos  $3.0 \pm 0.71$  but in *Claris* samples, there were no diazinon, no malathion, no chlorpyrifos from EL-Bagoria canal but from EL-Menofi drainage, mean value of diazinon  $6.8 \pm 1.42$ , malathion  $4.64 \pm 0.81$  and chlorpyrifos  $4.0 \pm 0.96$ .

Pesticides are one the main contaminant of water sources which are considered the natural environment of fish. On the other hand, fish could be contaminated by pesticides either directly by gills breathing or indirectly through contamination of feeding items so it is very important to analyze fish samples to detect to what extent the rate of accumulation of pesticides residues in fish flesh and organs.

**Keywords:** Organophosphorus; Diazinon; Malathion; Chlorpyrifos

### Introduction

Fish is low-fat high quality protein. Fish is filled with omega-3. Fatty acids and vitamins such as D and B2 (riboflavin). Fish is rich in calcium and phosphorus and great source of iron, zinc, iodine, magnesium and potassium. The American Heart Association recommends eating fish at least two times per week as part of a healthy diet. Fish is packed with protein, vitamins and nutrients that can lower blood pressure and help to reduce the risk of a heart attack or stroke.

Fish are known to be highly nutritious and excellent sources of animal protein which are consumed by larger percentage of the world's population because of its availability and palatability [1-3]. Fish and fish products are in the forefront of food safety and quality improvement because they are among the most internationally traded food commodities. Fish and fish products are one of the most important

food stuffs as they are one of the cheapest sources of animal protein. Fish are enriched with essential minerals, vitamins and unsaturated fatty acids [4-8]. Today, the environmental pollution is considered one of the most serious problems in the world. The deleterious effect of the environmental pollution of pesticides is one of the principal research activities 1962. Contamination of food at animal origin with organochlorine compounds and their metabolites has been reported in various countries [9,10].

Choudhary, *et al.* [11] reported that organophosphorus pesticides causes burning/stinging of eyes, blurred vision, skin redness and itching, excessive sweating and shortness of breath, dry sore throat and burning of nose among spray farmers of Bhopal, Madhya Pradesh India, who sprayed pesticides by themselves and therefore were directly exposed to pesticides.

When people come into contact with large quantities of pesticide, this may cause acute poisoning or long-term health effects, including cancer and adverse effects on reproduction [12].

Fish and aquatic animals are exposed to pesticides in three primary ways, the first way was through dermal by direct absorption through the skin by swimming in pesticide contaminated waters, the second is breathing by direct uptake of pesticide through the gills during respiration and the third way is oral by drinking pesticide contaminated water or feeding on pesticide contaminated preys. Poisoning of human being occur by consumption of poisoned fish, which termed (secondary poisoning) [13].

Priyadharshini, *et al.* (2017) reported that indiscriminate use and improper handling of synthetic pesticides in agriculture have resulted in serious problems such as asthma, wheeze and chronic bronchitis among the farmers.

### Aim of Work

This study is made for detection and determination organophosphorus in Nile *Tilapia* and *Claris* samples from EL-Bagoria canal, EL-Menofi drainage and Bahr Shibin in Menofia Governorate.

### Materials and Methods

45 fish samples of *Tilapia* and *Claris* from EL-Bagoria canal, EL-Menofi drainage and Bahr Shibin in Menofia Governorate for detection and determination of organophosphorus (Malathion, Diazinon and chlorpyrifos).

The collected samples were packed separately and transferred to laboratory for analysis.

Samples were extracted according to AOAC [14] and Pesticide Analytical Manual [15].

Fifty gram of samples were grinded with 100 gram of anhydrous sodium sulphate in presence of 150 gram of 40 - 60 petroleum ether for 2 minutes then extract was decanted through 500 ml Buchner funnel containing two whatman filter papers number 1/2.

The extract was poured through 40 x 25 mm column of anhydrous sodium sulphate and eluent was collected in 500 ml flask. Extraction and clean up by acetonitrile partitioning. Clean up by florisil column was firstly carried out by eluting the column with 200 ml of 50 petroleum ether/diethyl ether (v/v). The elute was concentrated by rotator evaporator to dry film which was dissolved by 2 ml n-hexane for HPLC determination.

Results

Pesticides	Positive samples in Bahr Shibin		Positive samples in EL-Bagoria canal		Positive samples in EL-Menofi drainage	
	No.	%	No.	%	No.	%
Diazinon	0	0%	0	0%	3	20%
Malathion	0	0%	2	13.3%	5	33.3%
chlorpyrifos	0	0%	3	20%	4	26.6%

Table 1: Statistical analysis of organophosphorus residues (ppb, wet weight) in examined Tilapia samples.

	Diazinon				Malathion				chlorpyrifos			
	Min	Max	Mean	St. error	Min	Max	Mean	St. error	Min	Max	Mean	± St. error
El-Bagoria	0	0	0.00	0.00	3.5	7.5	5.50	2.0	2.75	8.25	5.0	1.66
EL-Menofi	2.25	4.5	3.33	0.65	2.25	9.15	4.98	1.22	1.5	4.75	3.0	0.71

Table 2: Mean residue levels of organophosphorus pesticides (ppb, wet weight) in examined Tilapia samples from EL-Bagoria canal and EL-Menofi drainage.

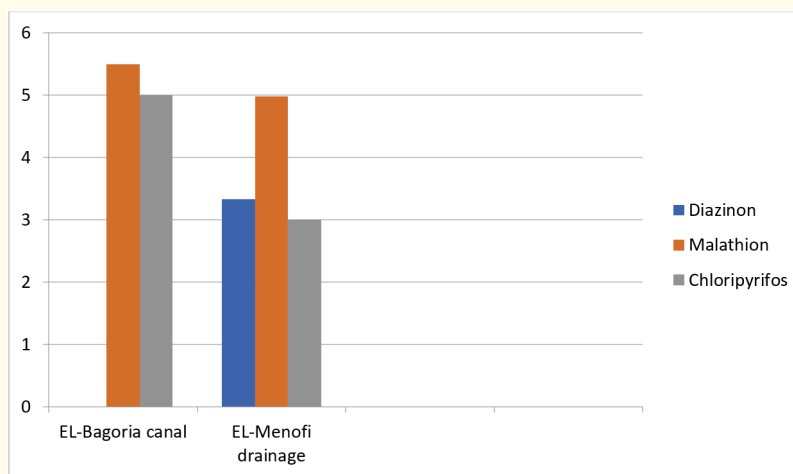

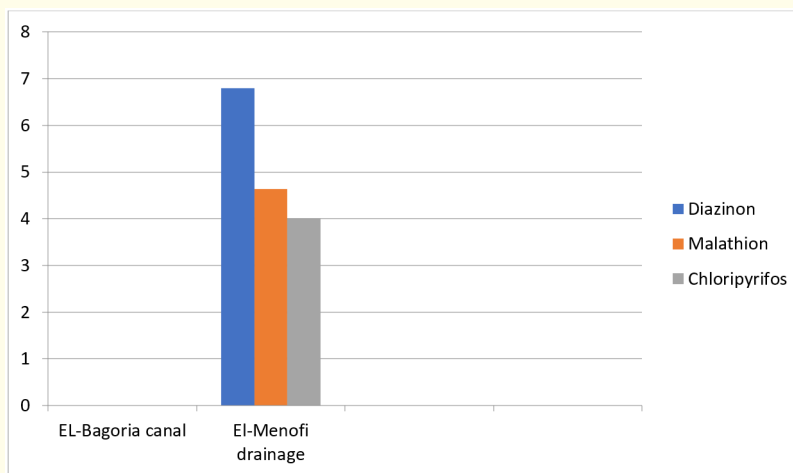

Figure 1: Mean residue levels of organophosphorus pesticides (ppb, wet weight) in examined Tilapia samples from EL-Bagoria canal and EL-Menofi drainage

Pesticides	Positive samples in Bahr Shibin		Positive samples in EL-Bagoria canal		Positive samples in EL-Menofi drainage	
	No.	%	No.	%	No.	%
Diazinon	0	0%	0	0%	6	40%
Malathion	0	0%	0	0%	9	60%
chlorpyrifos	0	0%	0	0%	5	33.3%

Table 3: Statistical analysis of organophosphorus residues (ppb, wet weight) in examined Claris samples.

	Diazinon				Malathion				Chlorpyrifos			
	Min	Max	Mean	St. error	Min	Max	Mean	St. error	Min	Max	Mean	± St. error
El-Bagoria	0	0	0.00	0.00	0	0	0.00	0.00	0	0	0.00	0.00
EL-Menofi	2.5	12	6.8	1.42	2.5	10	4.64	0.81	2	7.5	4.0	0.96

**Table 4:** Mean residue levels of organophosphorus pesticides (ppb, wet weight) in examined *Claris* samples from EL-Bagoria canal and EL-Menofi drainage.

**Figure 2:** Mean residue levels of organophosphorus pesticides (ppb, wet weight) in examined *Claris* samples from EL-Bagoria canal and EL-Menofi drainage

### Discussion

There were no organophosphorus pesticides in Bahr Shubin.

The results on the table 2 and figure 1 revealed that no diazinon in *Tilapia* from EL-Bagoria but mean level of malathion  $5.50 \pm 2.0$ , chlorpyrifos  $5.0 \pm 1.66$  but from EL-Menofi drainage, mean level of diazinon  $3.33 \pm 0.65$ , malathion  $4.98 \pm 1.22$  and chlorpyrifos  $3.0 \pm 0.71$ . in *Claris* samples there was no diazinon, no malathion, no chlorpyrifos while from EL-Menofi drainage, mean value of diazinon  $6.8 \pm 1.42$ ,  $4.0 \pm 0.96$ .

The results of diazinon in *Tilapia* from EL-Menofi drainage were higher than that detected by Ibigbami, *et al.* [16] and Yahia and EL-Sharkawy [17].

The results of malathion in *Tilapia* from EL-Bagoria canal and from EL-Menofi drainage were higher than that detected by Soumis, *et al.* [18] and Yahia and EL-Sharkawy [17].

The results of chlorpyrifos in *Tilapia* from EL-Menofi drainage were equal to that detected by Soumis, *et al.* [18] but in *Tilapia* from EL-Bagoria canal were higher than that detected by Soumis, *et al.* [18] and Yahia and EL-Sharkawy [17].

The results of diazinon in *Claris* from EL-Menofi drainage were higher than that detected by Ibigbami., *et al.* [16] and Yahia and EL-Sharkawy [17].

The results of malathion in *Claris* from EL-Menofi drainage were higher than that detected by Soumis., *et al.* [18] and Yahia and EL-Sharkawy [17].

The results of chlorpyrifos in *Claris* from EL-Menofi drainage were higher than that detected by Soumis., *et al.* [18] and Yahia and EL-Sharkawy [17].

### Conclusion

Organophosphorus pesticides are one the main contaminant of water sources which are considered the natural environment of fish. On the other hand, fish could be contaminated by organophosphorus pesticides either directly by gills breathing or indirectly through contamination of feeding items so it is very important to analyze fish samples to detect to what extent the rate of accumulation of organophosphorus pesticides residues in fish flesh and organs.
