Keywords: *Low Vision; Visual Rehabilitation*

A retrospective study was done on 55 patients in the month of November 2021 at Mahavir Netralaya kankarbagh Patna to access the utility of household items in visual rehabilitation. Majority of the patients were of poor social economic background. Consent for the research was taken before study, no invasive technique was used. Majority of the patients express satisfaction and availability to perform simple day to day task. The researcher recommended aids as needle threader, torch light and most importantly individual counseling as per their profession. There was a bell shaped distribution of patients who participated in the research, with majority of the subjects were in the 2nd to 5th decade of life. Only 1/5th of subject were female an 4/5th are male, before coming the visual acuity of the subjects were overwhelmingly poor and had limited scope of correction using lens or glasses [1-15].

Figures

The author concludes that humble counseling and individual training can do miracles in patients who had no hoops of normal lifestyle with household items which are very convenient.
